

Abstract of the Disclosure

A plate changing apparatus includes a loader, air cylinder, and removed plate recovery section. The loader is supported by a frame to be movable substantially parallel to a sheet convey direction, and
5 feeds a new plate to a plate cylinder. The air cylinder moves the loader from a retreat position to a wait position close to the plate cylinder during plate changing. The removed plate recovery section is fixed to the frame and recovers an old plate discharged from
10 the plate cylinder.
